Homework 2 (No Late Homework)

Due on **10/9/2022** at the beginning of the class

Mastering Asymptotic Notations in non-recursive programs

2 pages

5 Questions

Total Points: 100

Question 1: Because the definition of big O is $T(n) \leq c \cdot g(n)$ for some constant c and integer $n \geq n_0$, for $T(n) = 2^{n+1}$ and $O(2^n)$, c would have to be 2, and n_0 would have to be 1. For example, when $n=2$, $T(2)=8$ and $2g(2)=8$, satisfying big-O. Another example would be $n=3$, where $T(3)=16$ and $2g(3)=16$. This satisfies big-O notation

- (10 points) (Formally) Prove or disprove $T(n) = 2^{n+1}$ is $O(2^n)$ by using the definitions of the notations involved or disprove it by giving a counterexample.
- (50 Points) Complexity analysis. What is the order of growth of the worst-case running time of the following code fragments? n is the input size.

(a) (10 Points)

```
for (int i=0; i<n; i++)
{
    for (int j = i; j<n; j++)
        S; // S is O(1);
}
```

$O(n^2)$

(b) (10 points)

```
int i = n;
while (i > 1)
{
    S; // Let assume S's O(1)
    i = i/2;
};
```

$O(\log_{\text{base}=2}(n))$

(c) (10 points)

```
for (int i=0; i<n; i++)
{
    for (int j = i; j<n; j++)
        S; // S is O(1);
}
```

$O(n^2)$

(d) (10 points)

```

int i = n;
while (i > 1)
{
    j = i;
    while (j < n)
    {
        S; // Let assume S's O(1)
        j = j * 2;    n * (log base 2 of n)
    };
    i = i / 2; log base 2 of n
}

```

answer: $O(n \cdot \log_{\text{base}=2}(n))$

(e) (10 points)

```

int i = n;
while (i > 1000)
{
    S; // Let assume S's O(1)
    i = i*2;
};

```

 $O(n \log_{\text{base}=2}(n))$ compiler error. Whenever $n \leq 1000$, it iterates 0 times. When $i > 1000$, it iterates infinitely.

3. (10 Points) What is Big-O?

(a) $n(\log_2 n)^2 + n(\log_2 n)$ (b) $n^{1.1} + 2n^{1.75}$ a. $O(n \log_{\text{base}=2}(n))$ b. $O(n^{1.75})$ 4. (20 Points) You need to show your work to get the credits. Solve the recurrence relation using the forward/backward substitution.

(a) (10 Points) (Show the work.)

 $T(n) = T(n-1) + 1$ for all $n \geq 0$ and $T(0) = T(1) = 1$

$$\begin{array}{l}
 4. \quad T(n) = 2T(n-1) + 1 \quad \forall n \geq 0, T(0) = T(1) = 1 \\
 \begin{array}{l}
 n \quad T(n) \\
 2 \quad T(2) = 2T(1) + 1 = 2 + 1 = 3 \\
 3 \quad T(3) = 2T(2) + 1 = 4 + 1 = 5 \\
 4 \quad T(4) = 2T(3) + 1 = 6 + 1 = 7 \\
 \vdots \\
 n \quad T(n) = 2T(n-1) + 1 = 2(n-1) + 1 = 2n - 1 \in O(n)
 \end{array}
 \end{array}$$

$$\text{RECURSIVE DEFINITION: } T(n) = \begin{cases} 1 & \text{if } n=1 \text{ or } n=0 \\ 2T(n-1)+1 & \text{else} \end{cases}$$

(b) (10 Points) You need to show your work to get the credits. Solve the recurrence relation using the forward/backward substitution. (Show the work.) $T(N) = 2T(N-1) + 1, N \geq 1, T(1) = 1$

$$6. \quad T(N) = 2T(N-1) + 1, N \geq 1, T(1) = 1$$

$$\text{RECURSIVE DEFINITION: } T(N) = \begin{cases} 1 & \text{if } N=1 \\ 2T(N-1)+1 & \text{else} \end{cases}$$

$$\begin{array}{l}
 N \quad T(N) \\
 N \quad T(N) = 2T(N-1) + 1 \\
 N-1 \quad T(N-1) = 2T(N-2) + 1 \\
 \vdots \\
 3 \quad T(3) = 2T(2) + 1 = 4 + 1 = 5 \\
 2 \quad T(2) = 2T(1) + 1 = 2 + 1 = 3 \\
 1 \quad T(1) = 1
 \end{array}$$

$$T(N) = 2T(N-1) + 1 = 2(N-1) + 1 = 2N - 1 \in O(N)$$

5. (10 Points) Use the master method to solve the following recurrence

$$T(n) = 4T(2n/3) + n^2$$

a. (2 Points) What is the value of a?

a. 4

b. (2 Points) What is the value of b?

b. 6

c. (2 Points) What is the value of d?

c. 2

d. (4 Points) What is the Big-O?

d. $O(n^2)$
